

A

OSAVUA

reference 8.45 | prediction 2.10 | residual +6.35 mmol g⁻¹

B

VAGTAA01

reference 8.36 | prediction 2.69 | residual +5.68 mmol g⁻¹

C

VAGTAA

reference 6.51 | prediction 1.75 | residual +4.77 mmol g⁻¹

D

The strongest calibrated failures are chemically large

E

Independent structural context

Verified literature annotation

Villajos et al., SI Table S4:
 VAGTAA01 = Mg / OMS Yes;
 OSAVUA = Ca / OMS Yes.

VAGTAA numerical context

Exact independent source for the previously quoted
 LCD, void fraction and density remains pending.
 Those numbers are not shown here.

Interpretation boundary

Local-site / confinement remains a hypothesis.
 These annotations do not independently validate
 the present CO₂ labels or prove a unique mechanism.
